LI LIN*, YU CHEN*, QI FANG*, LI DEHONG*, LIU BEICHEN**, *National Institute of Occupational Health & Poison Control 29 Nan Wei Road, Beijing 100050, P.R.China. **Institute of Industrial Health, AISG, Anshan, 114001, China.

Text (Limited to 200 words)

Key Words silicosis, TNF- α , TNFR II

To approach the role of tumor necrosis factor- α (TNFR - α) and tumor necrosis factor receptor II (TNFR II) gene polymorphisms in genetic susceptibility to silicosis. Two hundred and fifty nine case with silicosis and 341 silica-dust exposure workers (control) were selected, and the cases with silicosis were divided into three subgroups based on images of chest X-ray film, Using polymerase chain reaction-restriction fragment length polymorphisms (PCH-RELP) techniques, TNF- α and TNFR II gene polymorphisms were analyzed.

The distribution frequencies of G/A+A/A (TNFR - α 308) and T/G + G/G (TNFR II 196) genotypes showed no significant difference in silicosis compared with control, also in 1:1 paired matching. The risk of silicosis in those with G/A+A/A genotype was 6.74-fold higher than G/G genotype (OR=6.74,95%ci:1.01~44.99) in subjects whose exposure time was less than 15 years, TNF- α and TNER II gene polymorphisms didn't play an important role in susceptibility to silicosis of Han race. The risk of silicosis in those with G/A+A/A genotype was significantly higher than G/G Genotype in low accumulative exposure.
